

Primenest Realty — Broker Operating System (Lead Routing & SLA Engine)

An automated lead-management system built for a real estate brokerage that captures leads from multiple channels, routes them to the right agent, and enforces response-time SLAs with built-in escalation.

CLIENT Primenest Realty	CATEGORY Lead Management & SLA Automation
CORE TOOLS GoHighLevel / CRM Workflow Builder, Tags, Opportunities	ROLE Automation Designer / Broker OS Builder

Overview

Primenest Realty needed a reliable way to capture leads from several different sources — website forms, inbound replies, and Facebook Lead Ads — and make sure every single one was routed to an agent and followed up on time. I designed a "Broker Operating System": a workflow that intakes leads, prevents duplicate processing, assigns ownership, and actively monitors agent response time against a service-level agreement (SLA), automatically escalating to the broker if a lead goes unanswered.

The Problem

Leads were arriving from multiple channels with no single, consistent process for handling them. Some leads had a known source and could go straight to an assigned agent; others didn't, and had no clear owner. There was no way to guarantee a fast response, no visibility into which leads were falling through the cracks, and no automatic alert when an agent missed a lead — meaning slow follow-up and lost deals.

The Solution

I built a multi-branch automation that acts as the brokerage's lead-intake and accountability system. It tags, routes, and assigns every lead the moment it arrives, then actively tracks whether the assigned agent responds within a set window — escalating automatically if they don't.

How the Flow Works

1. Trigger

The workflow starts the moment a lead is created through any of three entry points: a form submission, a customer reply, or a Facebook Lead Form submission — giving Primenest one unified intake process regardless of channel.

2. Workflow Guard (Duplicate-Run Check)

Before doing anything else, the flow checks whether the contact already carries the bos – system – auto assigned tag.

- If the tag is present: the workflow ends immediately. This prevents the same lead from being re-processed, re-tagged, or re-assigned every time they submit another form or reply.
- If the tag is absent: the lead is new to the system and the flow continues.

3. Lead Status Update & Tagging

The contact's Lead Status is set to “New” and tagged bos – lead status – new, creating a clear, filterable record of every fresh lead entering the pipeline.

4. Lead Source Check

The flow branches based on whether a Lead Source value exists on the contact:

Branch A — Lead Source Known

- Tags the contact lead_source_known.
- Assigns the lead to a designated agent.
- Sends an internal notification alerting the agent to the new assignment.
- Sends an instant confirmation email to the lead, so they know they've been heard.
- Starts the SLA clock: sets SLA Start Time to now, sets SLA Status to “On Time,” and tags bos – sla – on time.
- Waits 5 minutes before checking on agent response.

SLA Monitoring & Escalation

After the initial wait, the flow checks for the bos – agent action – responded tag:

- Agent responded: the flow checks whether First Response Time is already set. If it's empty, it stamps the response time and creates an opportunity for the lead. If it's already set, that branch simply ends.
- Agent has not responded: SLA Status is changed to “Warning” and an internal warning notification is sent to the agent, giving them a second chance to respond.

The flow then waits another 5 minutes and re-checks:

- If the agent responded during the warning window: SLA Status is reset to “On Time” and tagged accordingly.
- If still no response: SLA Status is set to “Breached,” a Breach Time is recorded, the contact is tagged as breached, and an internal notification is sent directly to the broker — ensuring a stalled lead is never silently lost.

Branch B — Lead Source Unknown

- Tags the contact lead_source_unknown.
- Assigns the lead directly to the broker, rather than an individual agent, so it still gets a clear owner even without source data.

Outcome & Impact

- Every lead, regardless of channel, is captured, tagged, and assigned automatically — no manual sorting needed.
- Duplicate processing is prevented via the workflow guard, keeping contact records clean.
- Agents are held accountable to a real response-time SLA, with automatic warnings before a breach occurs.
- Brokers get automatic visibility into stalled leads instead of discovering them after the fact.
- Leads with no known source still get a clear owner instead of falling through the cracks.

Skills Demonstrated

- Designing multi-trigger, multi-branch CRM automation
- Building guard conditions to prevent duplicate workflow execution
- Implementing time-based SLA tracking with wait steps and escalation logic
- Tag-based state management to track lead status through a pipeline
- Cross-role notification design (agent-level vs. broker-level alerts)

What's Next

Future iterations could add a second escalation tier (e.g. regional manager) if a broker-level alert also goes unanswered, a dashboard summarizing SLA performance by agent, and automatic lead reassignment if an agent consistently breaches SLA.
