

Automated Urgent-Email Triage & Logging System

An AI-powered Microsoft Power Automate flow that reads incoming emails, classifies their priority, alerts the team in Teams, and logs every message to Excel — no manual triage required.

CORE TOOLS AI Builder, Outlook, Teams, Excel Online	ROLE Automation Designer / Builder

Overview

Busy inboxes make it easy for time-sensitive emails to get buried under routine messages. This project solves that problem with an end-to-end Power Automate flow that watches an inbox, uses AI Builder to understand each email's content, flags anything urgent directly in Microsoft Teams, and keeps a running log of every email in Excel for reporting and follow-up.

The Problem

Manually scanning every incoming email to judge urgency and log key details is slow, inconsistent, and easy to forget under a busy workload. Important messages can sit unread for hours, and there's no structured record of what came in, when, or how it was handled.

The Solution

I built an automated flow in Power Automate that triggers the moment a new email arrives, uses AI to analyze and classify it, instantly notifies the team in Teams when something is urgent, and logs every email to an Excel table for tracking and reporting.

How the Flow Works

1. Trigger — When a new email arrives

The flow starts automatically as soon as a new email lands in the connected Outlook inbox, ensuring nothing has to be checked manually.

2. Analyze Email — AI Builder

The email body is passed to an AI Builder prompt/model, which reads the content and returns a structured analysis covering what the email is about, its category, and how urgent it is.

3. Parse JSON

A Parse JSON action breaks down the AI Builder response into usable fields — summary, category, and priority — so they can be used in later steps.

4. Condition — Is priority "Urgent"?

- If Urgent: a message is posted instantly to a Teams chat with the email's key details, so the right people see it right away.
- If not Urgent: the flow skips the alert and moves straight to logging.

5. Add Row to Excel

Regardless of priority, the flow logs the email's date, sender, subject, category, AI-generated summary, priority, and status as a new row in an Excel table — creating a searchable, always up-to-date record of every email processed.

Workflow Diagram

Outcome & Impact

- Urgent emails are surfaced in Teams within seconds of arriving, instead of waiting on manual inbox checks.
- Every email is automatically logged with a consistent, structured record — no more missed or forgotten messages.
- AI Builder removes the need for hand-written rules or keyword filters to judge urgency and category.
- The Excel log doubles as a lightweight reporting tool, showing volume and category trends over time.

Skills Demonstrated

- Designing multi-step, condition-based automation in Power Automate
- Integrating AI Builder for natural-language content analysis
- Working with JSON parsing and structured data between actions
- Connecting cloud services (Outlook, Teams, Excel Online) into one workflow
- Process design: turning a manual, error-prone task into a reliable automated system

What's Next

Future improvements could include adding priority-based routing to different Teams channels, generating a weekly summary report from the Excel log, or expanding the AI analysis to suggest a recommended response.
